

Introduction to CommunityViz

March 11, 2008

McLane Center at Silk Farm

Presented by the University of New Hampshire/NH GRANIT , the Jordan Institute, & NH Audubon with support from the NH GIS Conservation Collaborative

Today's Agenda

10:00

- Introductions
- What is CommunityViz?

10:30

- Build-out analysis with CommunityViz
- Basic build-out results
- Data requirements for basic build-outs
- Advanced analysis outputs
- Sharing results
- Program demonstration

11:30

- Case studies
- Community responses

12:00 Lunch

12:30

- Funding opportunities
- Web and other resources

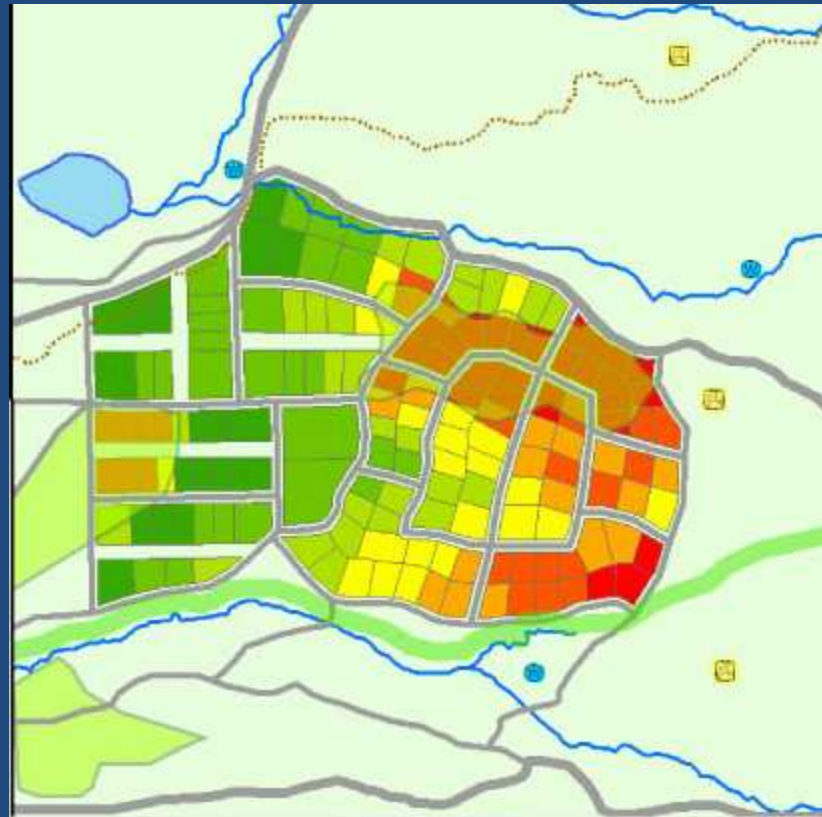

What is CommunityViz?

“Advanced yet easy-to-use GIS software designed to help people visualize, analyze, and communicate about important land use decisions.”
(communityviz.com)

Questions CViz can help answer

How suitable is a particular location for a new development?

Questions CViz can help answer

How might a zoning change affect important indicators of town health, prosperity, and environmental impact?

Questions CViz can help answer

At its current growth rate, how will a town's appearance change over time?

Questions CViz can help answer

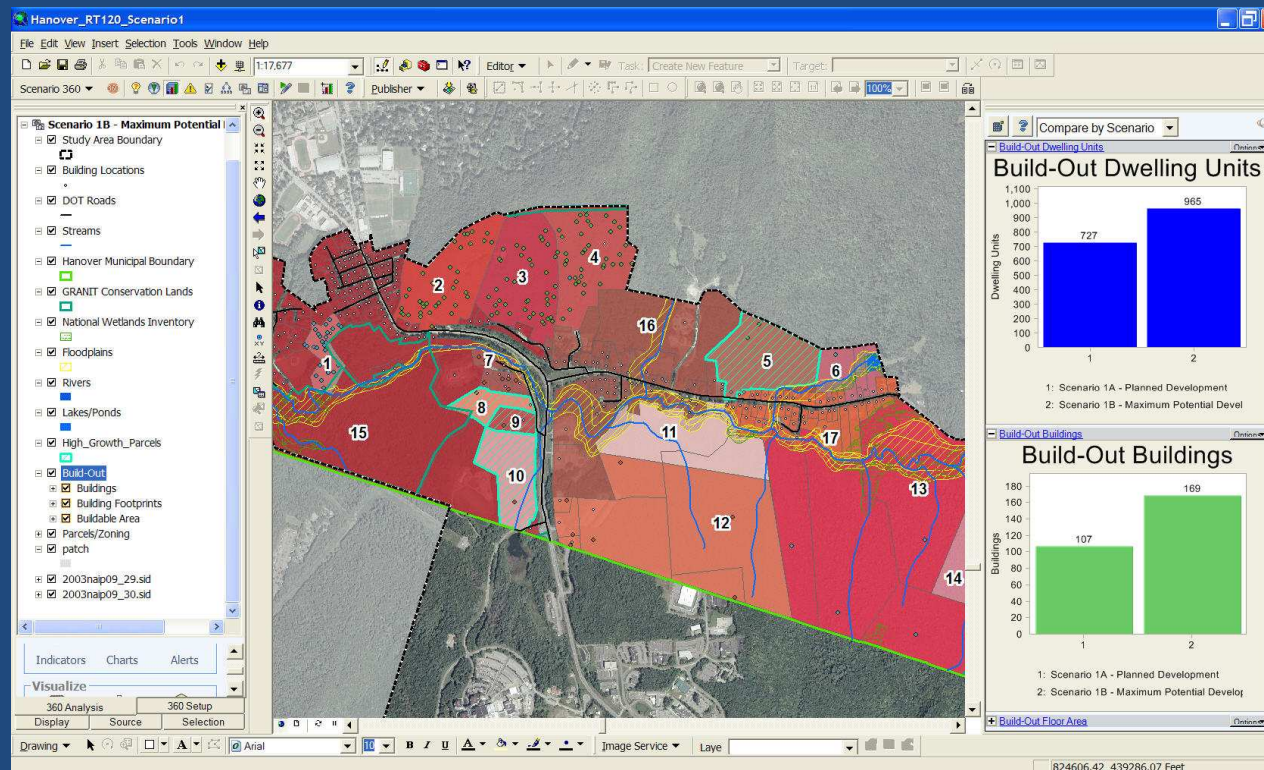

Which future development scenario does a community prefer?

Build-Out Analysis

What is a build-out analysis?

- Places future hypothetical buildings on a map according to land-use designations.
- Can be used to create many different scenarios for evaluation.
- Estimates the numeric capacity as well as spatial distribution of buildings in a scenario.

Build-out process involves three separate, but integrated steps:

1. Numeric build-out

- Provides an estimated building capacity (in numbers) for each parcel in the layer

2. Spatial build-out

- Places building points on a two-dimensional map

3. Visual build-out

- Associates spatial build-out building points with three-dimensional models

Inputs to build-out analysis...

1. Numeric:

- Density Rules and Efficiency Factors
- Building information
- Constraints to development
- Existing buildings

2. Spatial:

- Separation distances, setbacks, and layout patterns

The screenshot displays the 'Build-Out Wizard' software interface, specifically the 'Spatial Layout' configuration screen. The window title is 'Build-Out Wizard'. The main heading is 'Spatial Layout' with a sub-description: 'Set a minimum building separation distance and choose a layout pattern for each land-use designation. These settings define how buildings will be placed inside land-use areas.'

A checkbox is checked: Use the same road layer for every designation.

The main configuration area is a table with the following columns: Designation, Minimum Separation Distance (feet), Layout Pattern, Road or Line Layer, and Setback (feet).

Designation	Minimum Separation Distance feet	Layout Pattern	Road or Line Layer	Setback feet
1	30	Random	DOT Roads	35
10	50	Random	DOT Roads	50
11	0	Random	DOT Roads	0
12	0	Random	DOT Roads	50
2	30	Random	DOT Roads	30

Below the table, there is a link: [What do random, grid, and follow road layout patterns mean?](#) and an 'Advanced...' button.

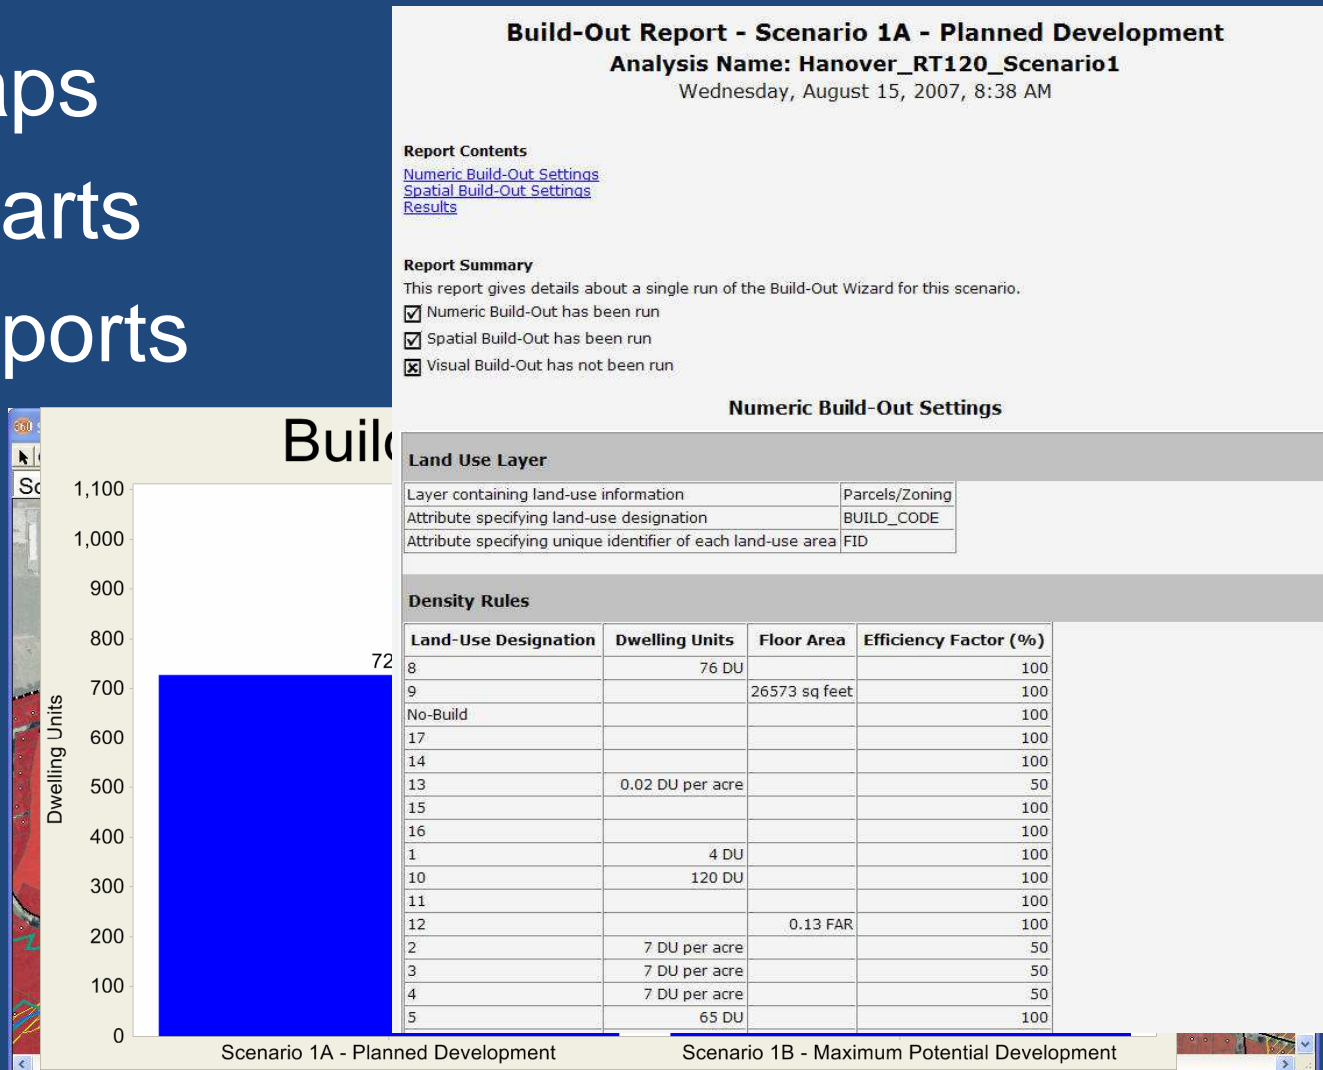

A note states: * This information has been populated using the Advanced option.

The bottom of the window features a navigation bar with buttons: '?', 'Save & Exit', '< Back', 'Next >', and 'Cancel'.

A second, partially visible screenshot below shows a similar interface with a dropdown menu set to '100' and a note: * This information has been populated using the Advanced option.

Results can be displayed as...

- Maps
- Charts
- Reports

Requirements for build-out analysis...

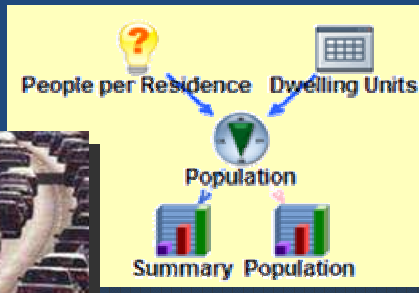

- Tax parcel data with zoning information attached
- Building locations with descriptive information
- Road centerline data
- Zoning ordinance
- Constraints data
- Close working relationship between GIS Analyst and Planner

Advanced Analysis Outputs

Common Impacts Analysis

- Automatically create socioeconomic and environmental impact analyses based on projected growth.
- Analyze impacts on auto emissions, energy use, tax revenue, water use, school kids ...

Vehicle Trips per Day
Common Impacts Calculation

Commercial Tax Revenue
Common Impacts Calculation

Commercial Jobs
Common Impacts Calculation

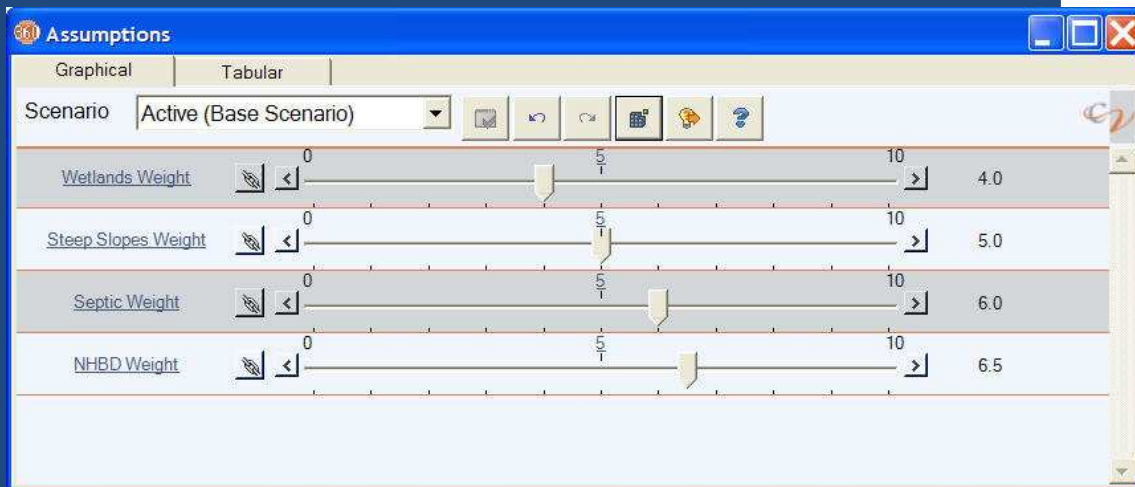

School Children
Common Impacts Calculation

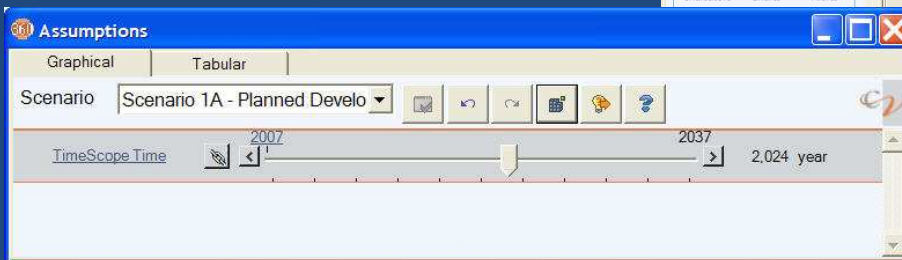

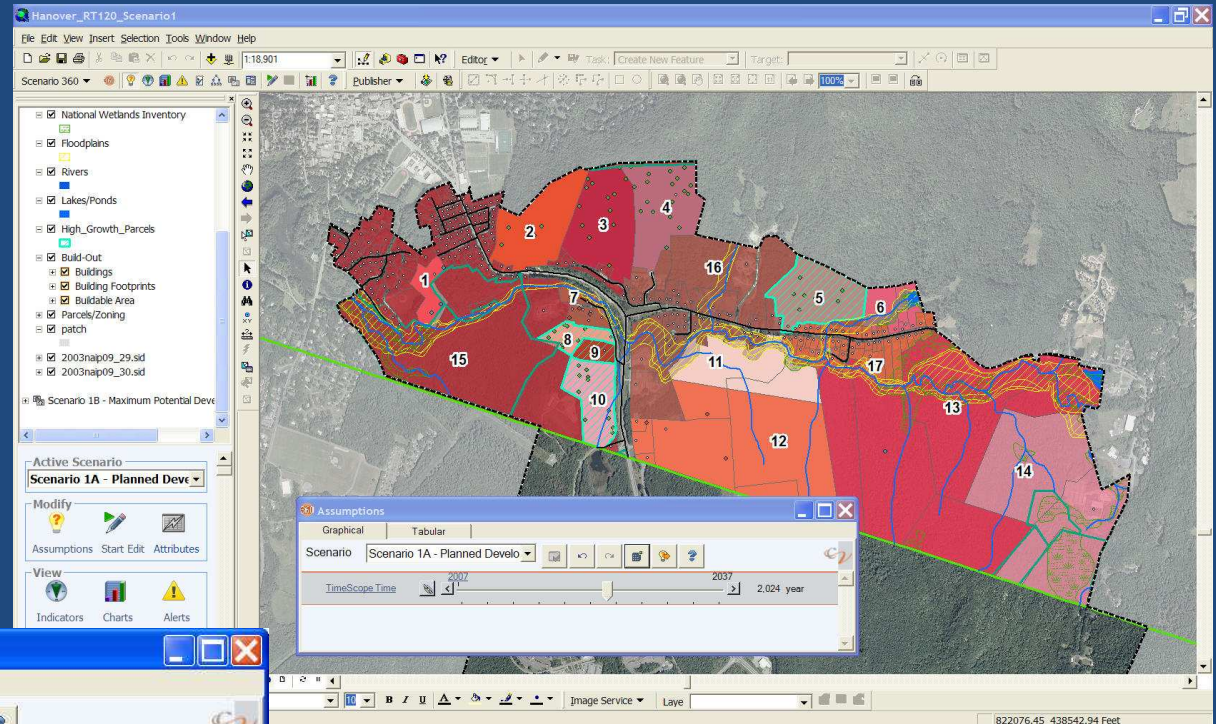

Suitability Analysis

- Assess the **desirability of locations**, e.g. where houses are most likely to be built (could be based on land cost, accessibility or other constraints to development).

Time Scope Analysis

- Model development over a specified period of time using growth rate and building sequence.

Sharing Results

A couple of free programs ...

- Google Earth (kmz)

- CommunityViz Analysis Viewer

Software Demonstrations

- Build-out analysis results with Time Scope
 - *Route 120 Corridor Management Plan, Hanover and Lebanon, NH*
- Fundraising potential
 - *Dover Mounted Police Unit*

Route 120 Corridor Management Plan

The Story: Background

The Route 120 Corridor is a valuable intercity and regional resource, linking two important New Hampshire municipalities in the Upper Valley of the Connecticut River - the City of Lebanon and the Town of Hanover. This resource includes Route 120 and associated infrastructure, existing development, vacant land, and natural resources. It plays a major role in the economic health of both communities and, very importantly, is the access from two interstates to Dartmouth Hitchcock Medical Center (DHMC) and the Centerra Business Park.

Route 120 Corridor Management Plan

The Story: Traffic

- Traffic has more than doubled on Route 120 since DHMC moved there from downtown Hanover:
 - 1989: 10,132 vehicles per day
 - 2004: 21,225 vehicles per day
- Increasing commuting distances due to lack of housing
- Peak hour congestion = back-ups onto I89

Dartmouth Hitchcock Medical Center

Route 120 Corridor Management Plan

The Story: Development Pressure

- In the past, improvements have been based on reaction to development, rather than planning ahead before development occurs.
- If market forces alone continue to shape future growth, the Route 120 area would continue to grow as a single use corridor likely necessitating expensive infrastructure improvements to mitigate travel demand.

Route 120 Corridor Management Plan

The Solution: Take a more proactive management approach

Phase I:

- Facilitate cooperation between Route 120 Corridor communities
- Encourage public participation in the planning process
- Gather data and enumerate existing conditions
- **Develop build-out scenarios estimating potential growth**

Phase II (awaiting funding):

- Identify options and alternatives for the use of the corridor
- Recommend initiatives that each community can pursue for the betterment of the corridor, including strategies for developing access management programs, corridor-specific land use policies, fiscal plans, capital improvement programs, and planning for any required long-term investments within the corridor

Route 120 demo ...

Dover Mounted Police Unit

The Story:

The Dover Mounted Police Unit (DMP) was initiated as part of the department's proactive approach to crime prevention, while re-allocating limited resources to provide more effective service. The DMP is a practical approach to specific law enforcement problems, providing increased visibility and approachability.

The DMP currently receives no tax funding. Therefore, they look to the community for sponsorship and volunteer support. As the DMP spends most of their time patrolling the downtown district, they have gained the moral and financial support of many of the downtown business owners. Other sources of sponsorship are somewhat unpredictable. The DMP could benefit from a more stable source of sponsorship from the greater Dover community.

The Dover Mounted Police comprises two full-time officers, one part-time officer, three Percheron draft horses, and a fleet of citizen volunteers.

The Paddock Project

The DMP has found that the citizens of Dover are very responsive to events where they can personally meet the unit, and have pictures taken of their children with the horses.

The Paddock Project would leverage this enthusiasm by offering DMP memberships to Dover families, and rewarding these contributions with special DMP visits to their neighborhoods.

The Paddock Project Concept

Divide the City of Dover into “Neighborhoods”...

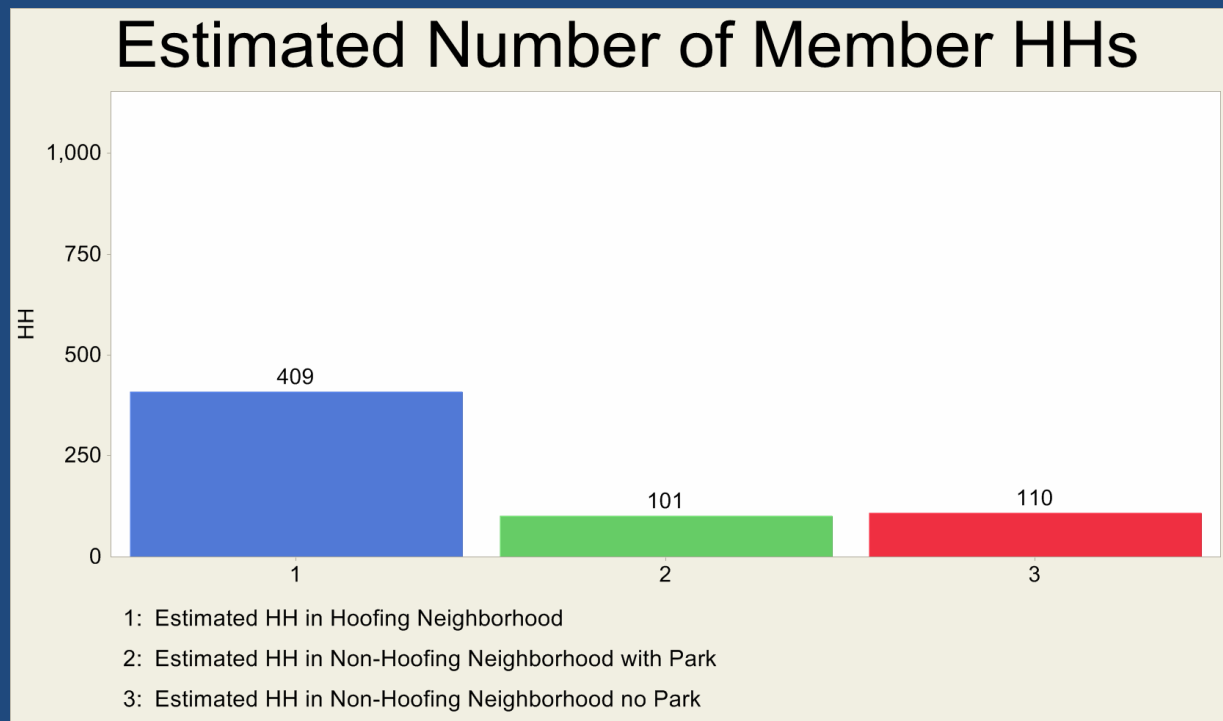

The Paddock Project Concept

Identify those “Neighborhoods” that contain a park that the horses can visit, and determine the distance from the DMP Stable to the park. Is the park close enough to the stable that it is “hoofable”? Or would the DMP need to trailer the horses to the park?

The Paddock Project Concept

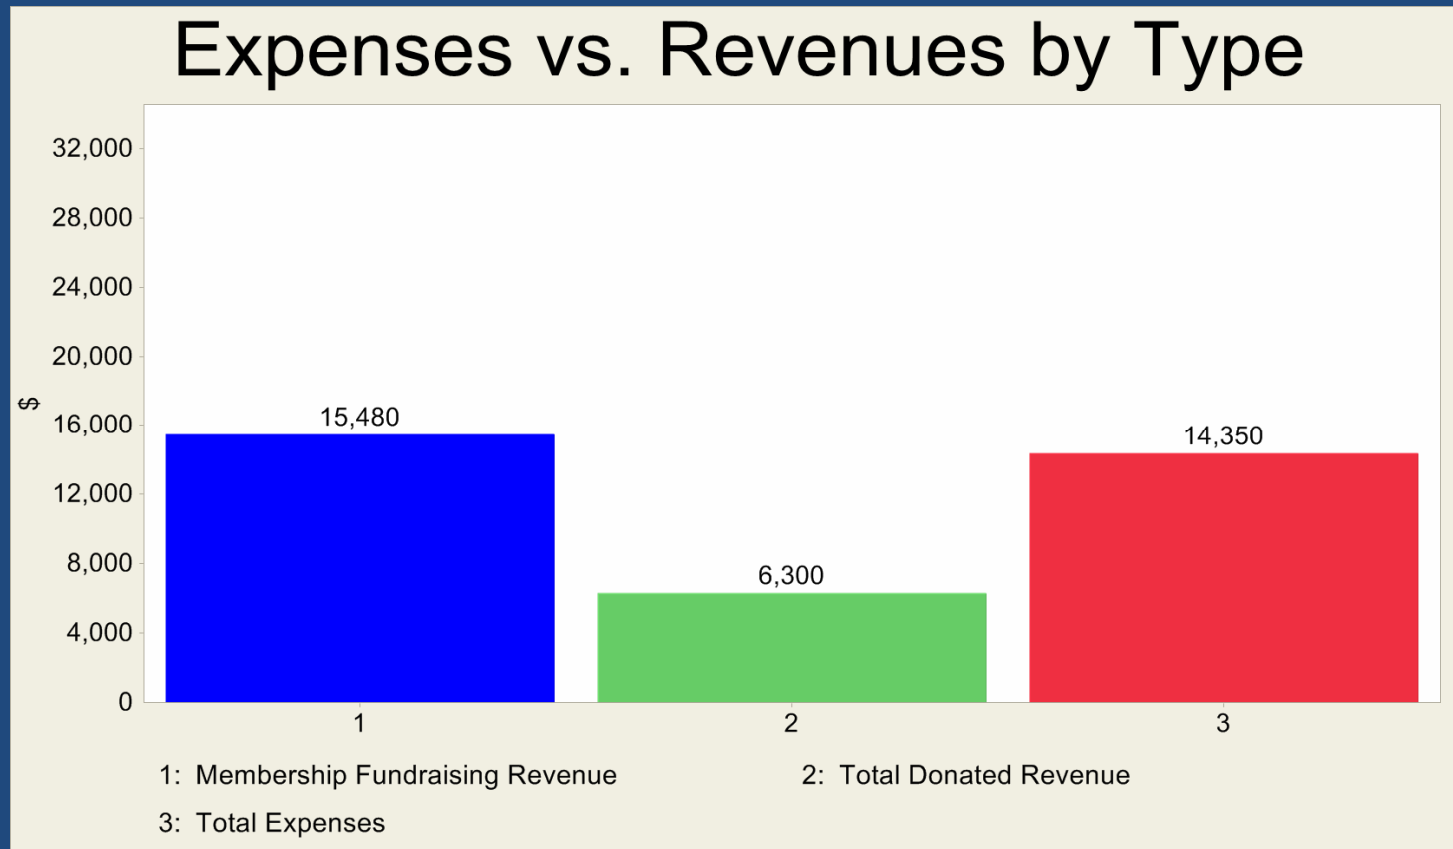

Estimate the number of households in each “Neighborhood”, the percentage of households in each “Neighborhood” that purchase memberships, and the average contribution per household. Those “Neighborhoods” that raise a target amount of funding will receive special visits from the DMP at their park.

It is assumed that those “Neighborhoods” that are not within “hoofing” distance, or that do not have a park, will generate fewer memberships. Those “Neighborhoods” that do not have parks would be invited to a visit elsewhere in town.

The Paddock Project Concept

Assess the annual membership fundraising revenue, revenues from other sponsorships/donations, and DMP expenses. Determine the overall fundraising potential for the DMP.

Case Studies

Chester, Hooksett & Salisbury

Goals:

How wildlife habitat protection can be incorporated into town planning

How the alternative scenario concept can inform local decision making

Funding was provided by NH Fish & Game Department and the Jessie B. Cox Charitable Trust

Case Studies Overview

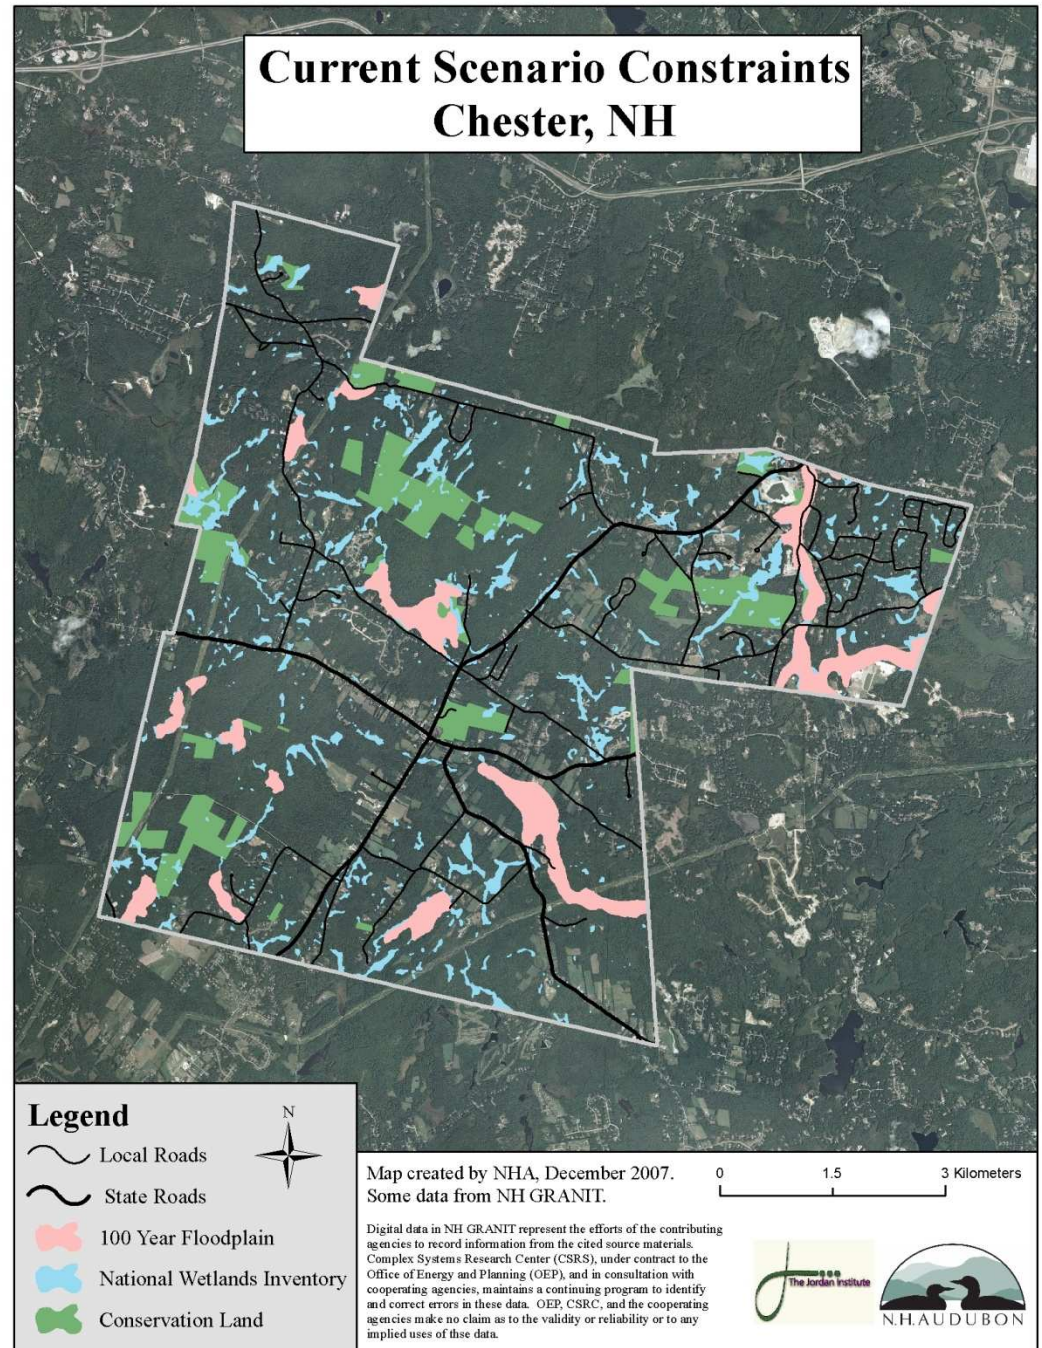

- 4 scenarios
- Used CTAP methodology and template
- Constraints
- Data
- Methods
- Maps
- Indicator charts
- Lessons learned in each community

Current Scenario

Current regulations
(setbacks, lot size)

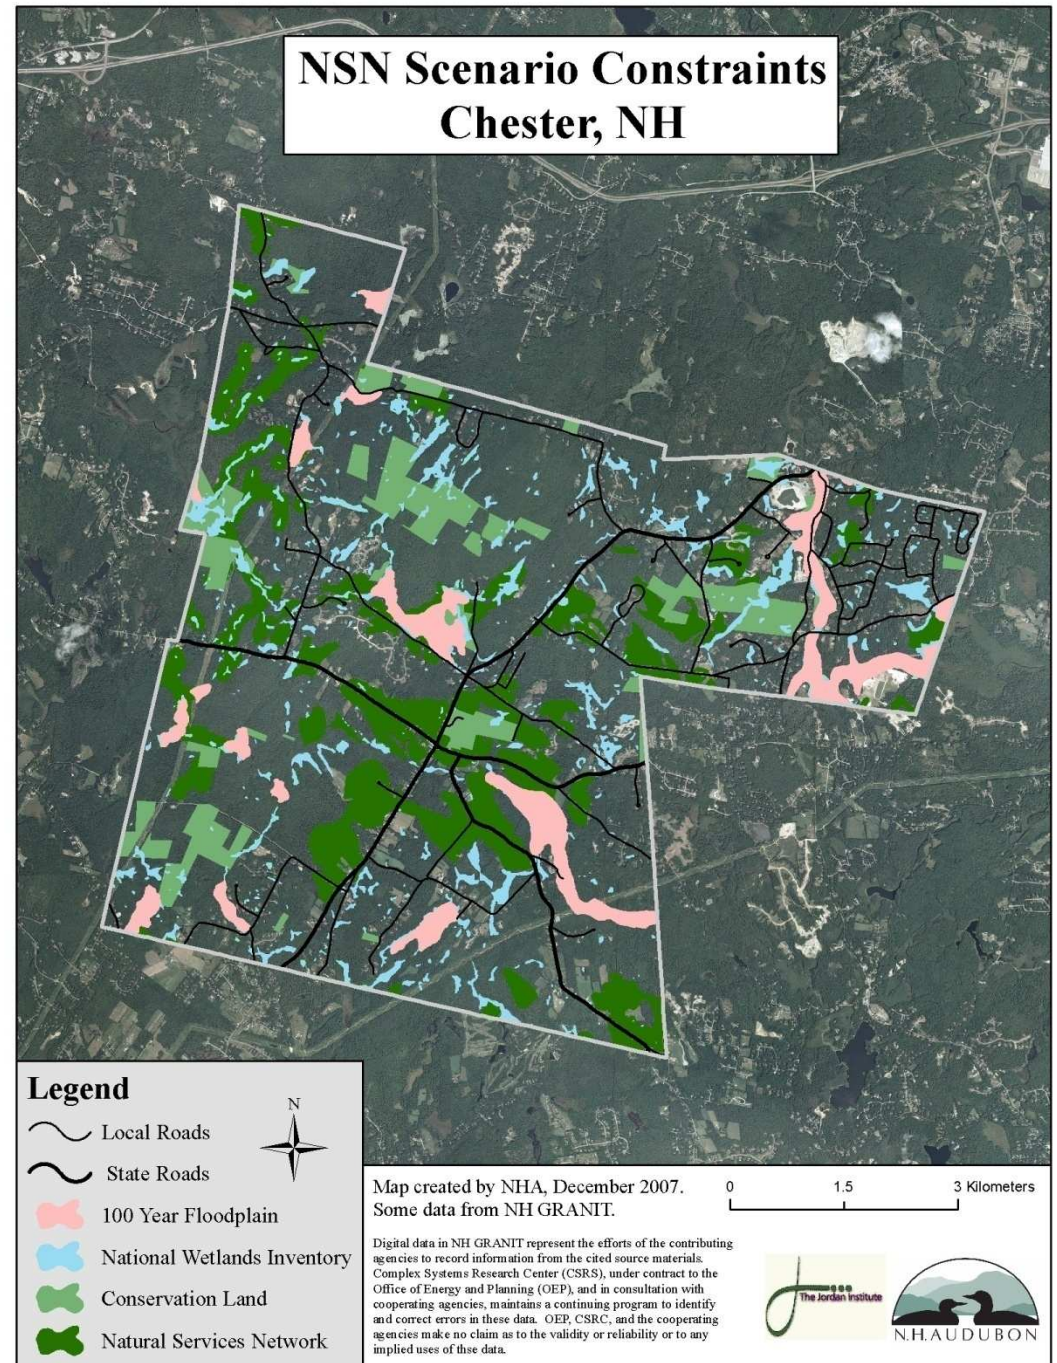

NWI wetlands
Conservation Land
100-Year Floodplain

NSN Scenario

Allowable densities were adjusted to allow for a growth neutral scenario

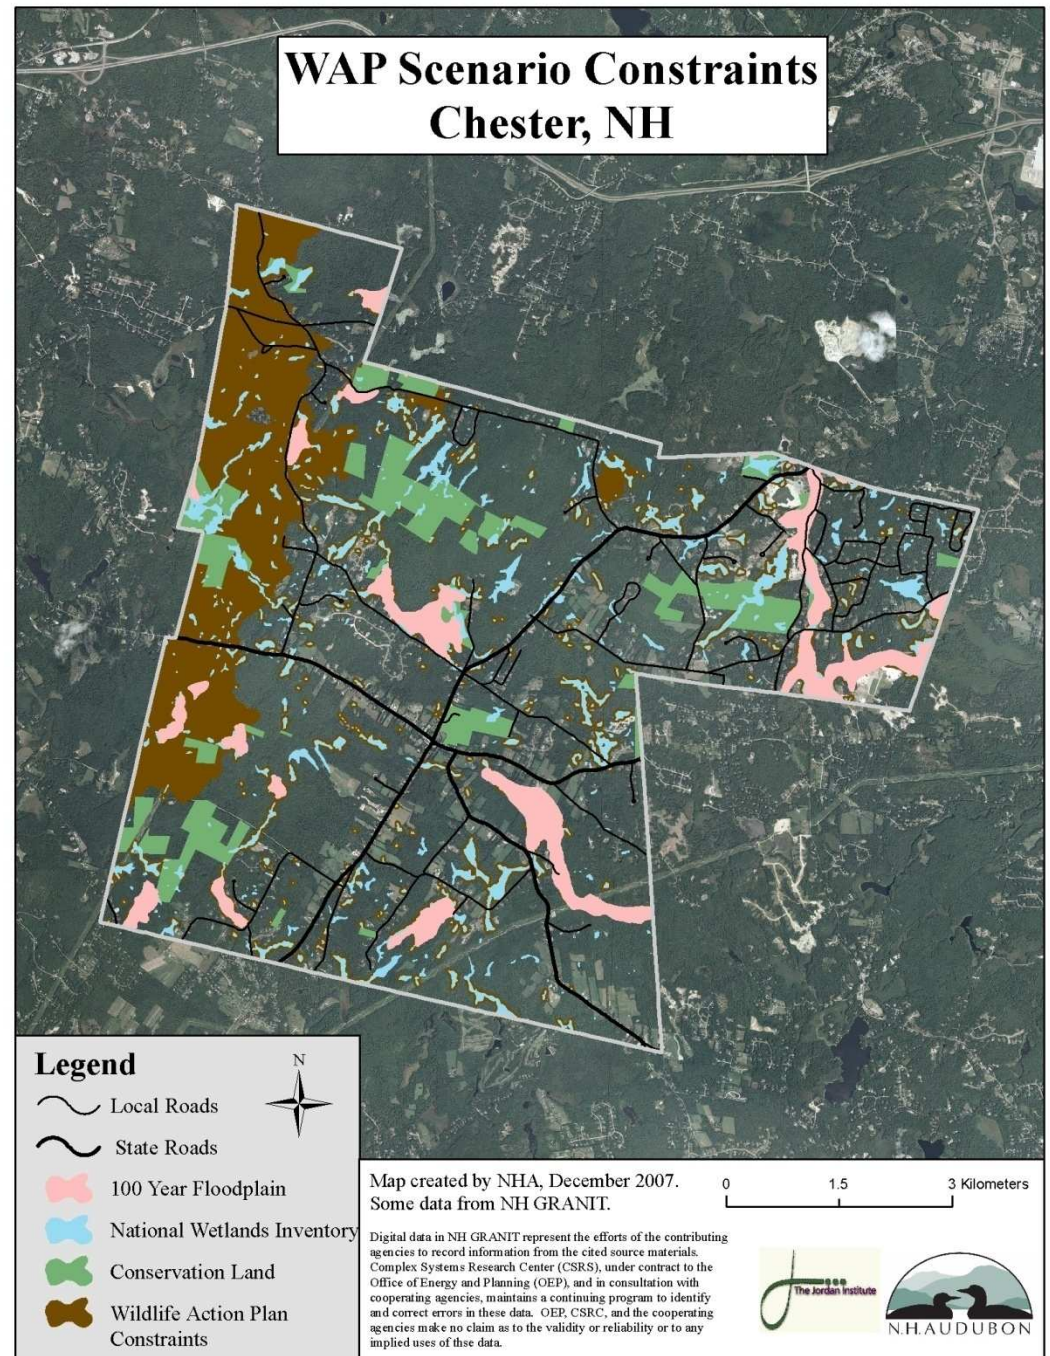

NSN added as a constraint

WAP Scenario

Different for
each town

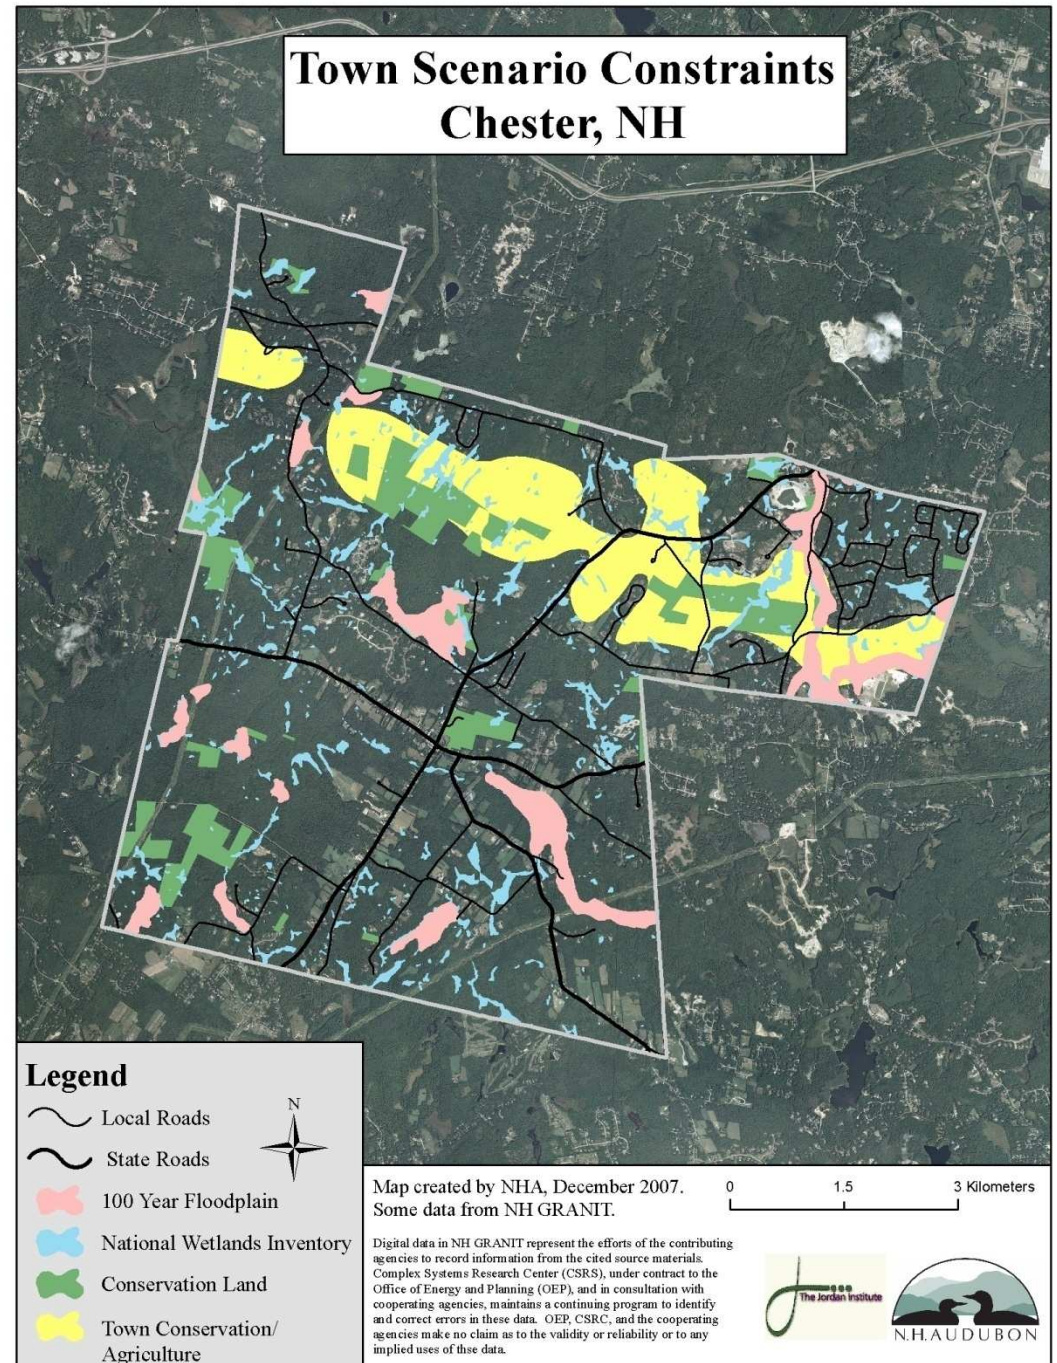

Certain WAP
habitats or areas
constrained in
addition to
base constraints

Town Scenario

Based loosely on features of the Master Plan

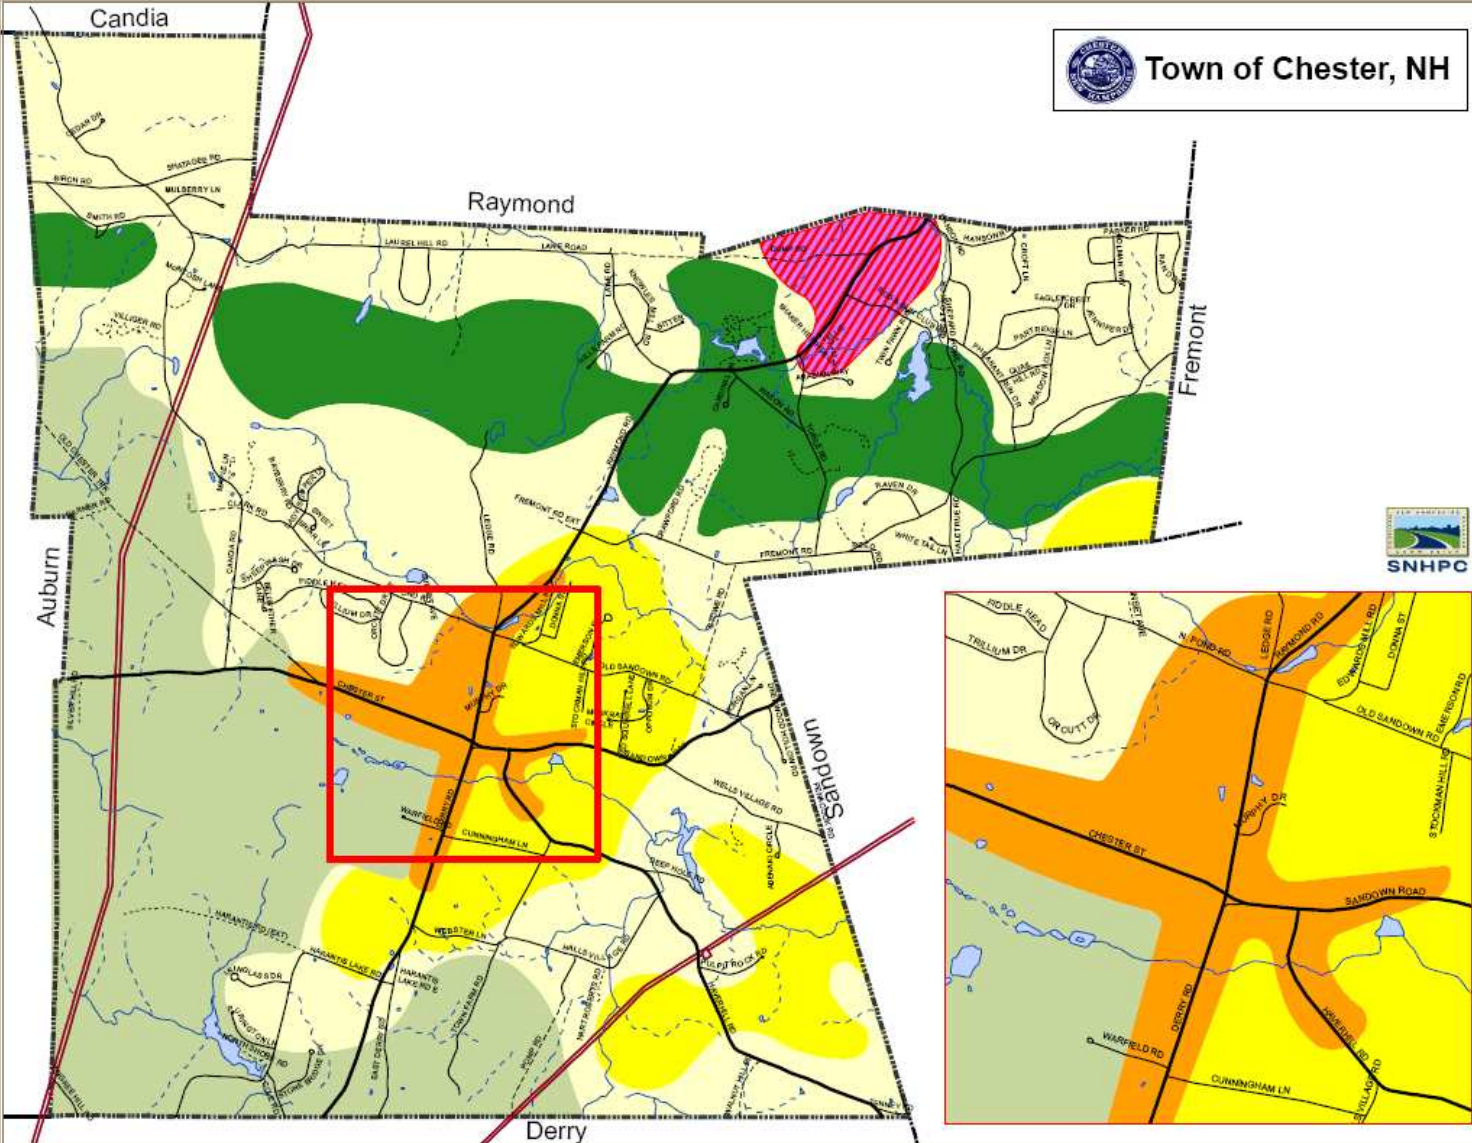

New constraints added

Town of Chester, NH

Map 16 Future Land Use

Legend

 Contact: SNHPC, gis@snhpc.org, PH: (603) 655-4054

This map is one of a series of maps that were produced as part of a Town's Master Plan 2006 and for planning purposes only. It is not to be used for legal boundary determination or for regulatory purposes.

Data Used in Analyses

Layer	Source	Constraint
100-Year Floodplain	FEMA	Yes
Amenities	DES, modified by NHA	No
Buildable Land (Chester, Hooksett)	Created by NHA using RPC data	No
Buildable Land (Salisbury)	Created by NHA	No
Community Centers	Created by NHA using DES data	No
Conservation Land	SPNHF	No
Current Buildings	Created by NHA	Yes
Land Use	Regional Planning Commission	No
Natural Services Network	Varies, see NH GRANIT	Yes
National Wetlands Inventory	USFWS	Yes
Roads	NH DOT	No
Sewer and Water Service	Regional Planning Commission	No
Tax Parcels	Regional Planning Commission	No
Wildlife Action Plan	NHFG	Yes
Zoning	Regional Planning Commission	No

Buildable Land

For CTAP towns:

- Vacant
- Agricultural
- Brush or transitional between open and forested
- Forested land
- Barren land (except for strip mine/quarry or gravel pit)

Buildable Land

For Salisbury, no build on:

- Hydric soils A and B
- Conservation easement properties
- Blackwater floodplain
- Slopes greater than 30%
- Roads
- Water
- Gravel pits
- Cemeteries
- Recreational areas

Current Buildings

- Digitized based on most recent aerial image (2005/2006)
- Primary buildings only
- Single-Family Residential, Multi-Family Residential, or Non-Residential
- # Dwelling units or gross floor area
- Based on town assessment data

Build-out Methods

Current regulations were examined for:

- Allowable uses by right
- Minimum lot size or density, including changes to the above due to service availability
- Floor area ratio
- Other regulatory overlays
- Setbacks: front, side and back
- Lot set-aside requirements
- Any other regulation that would significantly affect new development

Assessing Build-out Impacts

- Common Impacts Wizard:

Automatically generates several commonly used impact indicators associated with growth and development over time

- Custom Template:

Approximately 40 indicators in these categories:

Build-out totals

Transportation

Municipal Demands

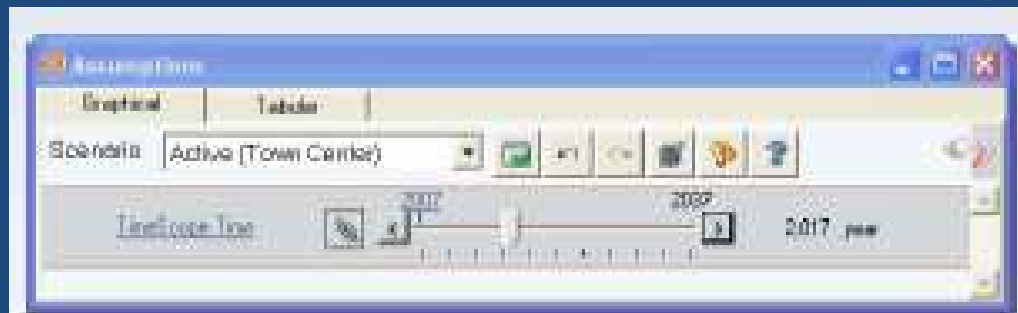

Demographics and Employment

Water and Energy Use

Land Use Characteristics

TimeScope Wizard

- Watch the build-out occur over time
- Set rules:
 - Rate over time
 - Proximity to another feature
- Used projected population rate or growth ordinance number
- Built-out in proximity to >Class VI roads first

Chester Indicators

Residential Dwelling Units Common Impacts Calculation

Commercial Floor Area Buildout

Fire and Ambulance Service Calls Per Year

Commercial Energy Use Water-Energy Use

Development Footprint Developed Acres per Person

Impervious Surfaces Percent of Town

Walkability Land Use Characteristics

Chester

The build-out analyses helped to visualize where WAP, NSN, and Town priorities differed

A future land use map helped to guide the Town/Master Plan Scenario

Hooksett

The complexity of Hooksett's zoning made it difficult to incorporate many changes

Presenting the build-out maps during public meeting created interesting discussion

Hooksett pursued further CommunityViz work with Complex Systems Research Center

Salisbury

Salisbury decided that educational materials that could be used in town were more important than pursuing a desired future scenario

Citizens' interest in the WAP and NSN made it easier to show how to incorporate these into town planning

Community Responses

- Trouble identifying with total build-out
- Different responses depending on how results were presented
- “Not on my land” mentality

- Appreciation for visual representation
- Indicator charts provided valuable information

Lessons Learned

It can be difficult to educate people about important natural resources and a new software tool at the same time

CommunityViz is an effective but challenging tool that requires patience, communication, and commitment

Paying for CommunityViz

- Program costs \$750 w/ technical support, \$279 self-service
- Teach yourself or hire someone else
- Include in Master Plan budget & contract
- Housing & Conservation Planning Program
- Moose Plate grants (NH State Conservation Committee)
- Resource-specific grants, e.g. CViz for watershed planning

NH CommunityViz Technical Resource Center

- Funded by the New Hampshire GIS Conservation Collaborative (NHGCC)
- Provide technical support to CommunityViz users throughout the state
 - CommunityViz selected as the build-out tool for the I93 expansion project
- Develop and host a website containing technical information and other resources
- Conduct pilot projects to build CommunityViz skill set
- Collaborate with The Jordan Institute (networking and promoting the use of the software)
